

Glass & Aluminum Recycling

Why's & How's

Glass Recycling

Why: Glass can be recycled endlessly with no loss in quality or purity. This means glass containers can last forever as they can be remade into new glass bottles and jars continually. Recycling glass decreases the impact on our environment because we're not mining raw materials which saves energy and CO2 emissions.

Aluminum Recycling

Why: Aluminum can also be recycled several times making it one of the most recycled-and recyclable materials. An aluminum can, car door or window frame are often recycled into the same product. When metals are reused it reduces the need to use raw materials, saves energy and water, and is less of an impact on the environment.

How: Bring glass bottles & jars, aluminum & tin cans along with other recyclable items to any drop off bin location in Polk County. For more information contact:
